Using
Variables

3D image
onto 2D space

Tikz in Physics

In the preamble,

```
\usetikzlibrary{decorations.pathmorphing}
```

In the document,

```
\begin{tikzpicture}
\node[circle, shade, shading=ball, ball color=black!20] (A)
    at (0,0) {A};
\node[circle, shade, shading=ball, ball color=black!20] (B)
    at (4,0) {B};
\draw[decoration={coil, aspect=0.3, segment length=1mm,
    amplitude=2mm, pre length=1.5mm, post length=1mm},
    decorate] (A) -- (B) node[pos=0.5, above=3mm] {$k$};
\end{tikzpicture}
```

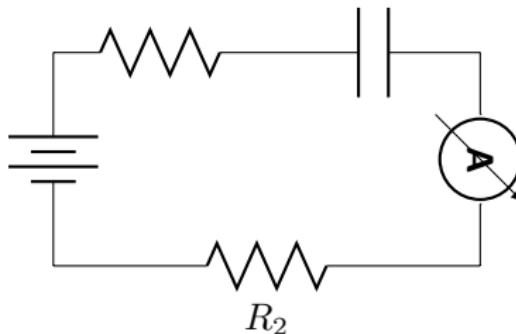

Tikz in Physics

In the preamble,

```
\usepackage{circuitikz}
```

In the document,

```
\begin{circuitikz}
\draw (0,0) to[battery] (0,2) to[R] (2,2) to[capacitor]
      (4,2) to[ammeter] (4,0) to[R=$R_2$] (0,0);
\end{circuitikz}
```

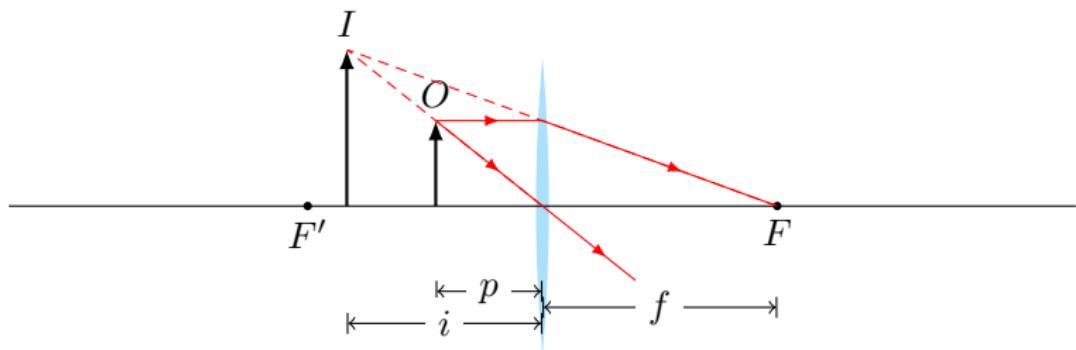

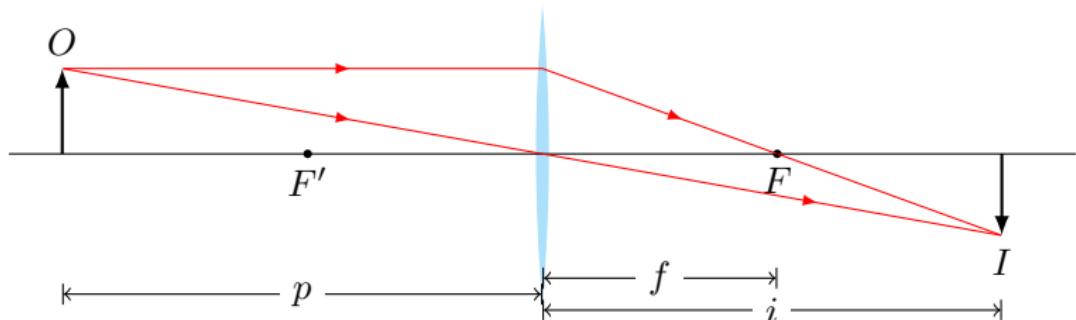

Using Variables

Tikz in
Physics

Using
Variables

3D image
onto 2D space

$$\frac{1}{p} + \frac{1}{i} = \frac{1}{f} \quad (\text{Lens law})$$

Using Variables

Let's make a macro in the preamble:

```
\newcommand{\ConvLens}[3]
% {<focal length>}{<object distance>}{<object height>}
\begin{tikzpicture}
% drawing here~~
\end{tikzpicture}
}% end of newcommand
```

Then write the defined command in the document as follows

```
\begin{document}
\ConvLens{2.2}{4.5}{0.8}
\end{document}
```

Using Variables

First of all, we define additional parameters in the tikzpicture environment (in 'ConvLens' newcommand).

```
%% [1] variables %%  
\def\R{16} % curvature radius of lens  
\def\tht{5} % angular size of lens[degree]  
\def\img{#2*#1/(#2 - #1)} % image's distance from lens  
\def\h{-#3*#1/(#2 - #1)} % image height
```

Then focal point, object's position, and image's position are named as 'F', 'O', 'I' for simplicity:

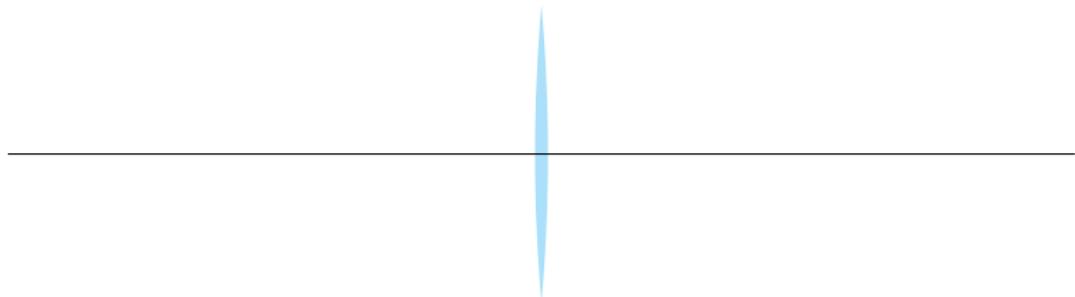

```
%% [2] positions %%  
\node[inner sep=0cm,minimum size=0cm]  
    (F) at (#1,0) {}; % focal point  
\node[inner sep=0cm,minimum size=0cm]  
    (O) at (-#2,#3) {}; % object  
\node[inner sep=0cm,minimum size=0cm]  
    (I) at (\img,\h) {}; % image
```

Using Variables

Drawing the converging lens and the central line:

```
%% [3] lens %%
\fill[cyan!30] (0,{\R*sin(\tht)}) arc ({180-\tht}:{180+\tht}:\R)
              arc (-\tht:\tht:\R); % converging lens
\draw (-5,0) -- (5,0); % central line
```

Tikz in
Physics

Using
Variables

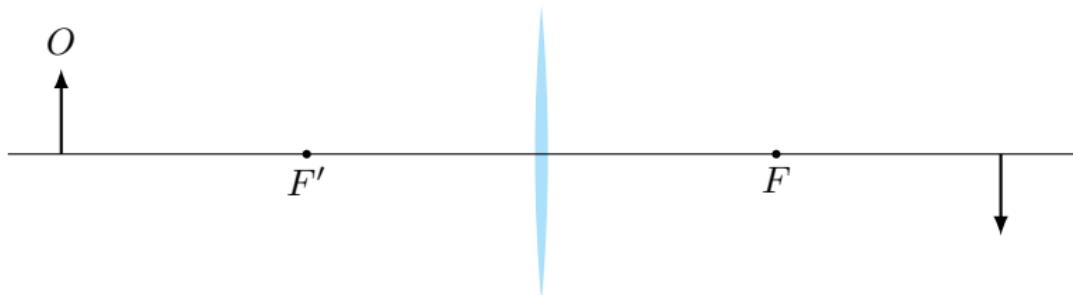

3D image
onto 2D space

Using Variables

Drawing symbols:

```
%% [4] symbols %%  
\fill[black] (F) circle (0.04)  
          node[below]{$F$}; % focal point  
\fill[black] (-#1,0) circle (0.04)  
          node[below]{$F^{\prime}$}; % focal point 2  
\draw[-latex,thick] (-#2,0) -- ++(0,#3)  
          node[pos=1,anchor=south]{$O$}; % object  
\draw[-latex,thick] ({\i},0) -- ++(0,{\h}); % image
```

The location of letter 'I' is different depending on the image's orientation.

Tikz in Physics

Using Variables

3D image onto 2D space

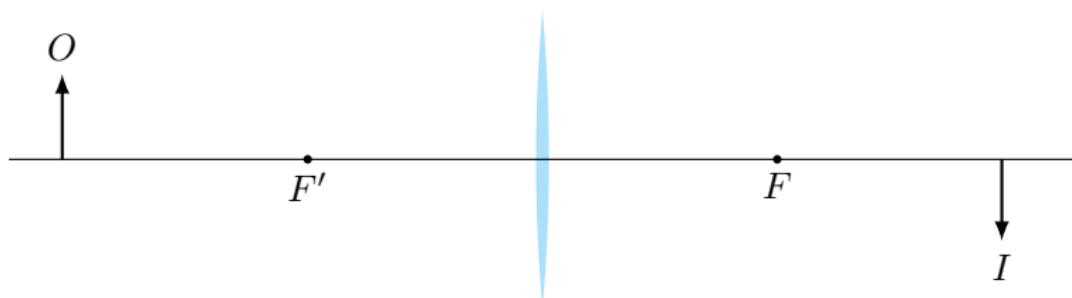

Using Variables

Inserting the letter 'I' using 'ifthenelse':

- Write `\usepackage{ifthen}` in the preamble.
- In the `tikzpicture` environment, write follows

```
%% [4-1] 'I' automatic positioning %%  
\ifthenelse{\lengthtest{#2 cm < #1 cm}}  
  {\node[above] at (I) {$I$};}  
  {\node[below] at (I) {$I$};}
```

Using Variables

Before drawing rays, we'll define a new arrow 'middlearrow'. In the preamble, write that

```
\usetikzlibrary{decorations.markings}
\tikzset{middlearrow/.style=
  {decoration={markings,
    mark=at position 0.6 with {\arrow{latex}}}},
  postaction={decorate}}
}
```

then we can obtain a line with the arrow head near the mid-point:

```
\begin{tikzpicture}
\draw[middlearrow,red] (0,0) -- (4,0);
\end{tikzpicture}
```

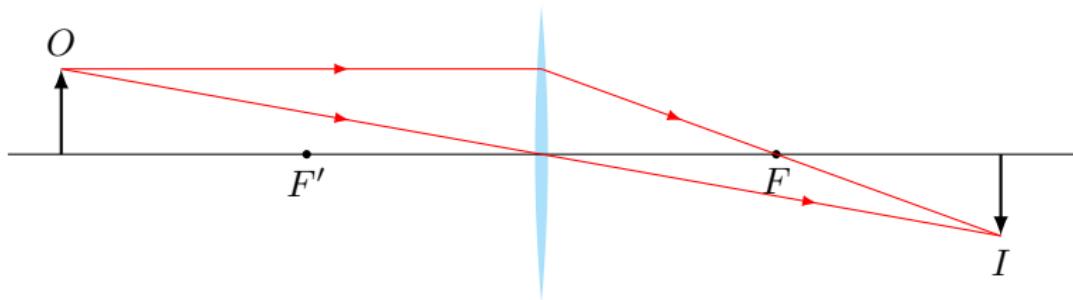

Using Variables

Tikz in
Physics

Using
Variables

3D image
onto 2D space

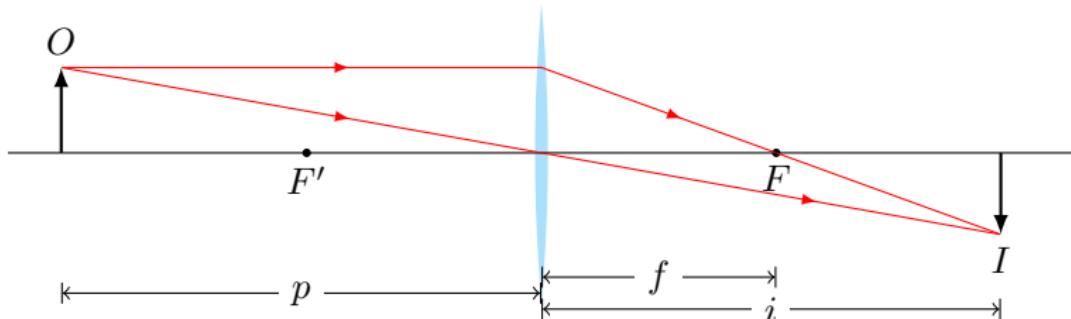

```
%% [5] drawing rays %%
\draw[middlearrow,red] (0) -- (0,0);
\draw[middlearrow,red] (0) -- (0,#3);
\draw[middlearrow,red] (0,#3) -- (F);
\ifthenelse{\lengthtest{#2 cm < #1 cm}}
  {\draw[densely dashed,red] (0,0) -- (I);
   \draw[densely dashed,red] (F) -- (I);
   \draw[middlearrow,red] (0,0) -- (#2,-#3);}
  {\draw[middlearrow,red] (0,0) -- (I);
   \draw[red] (F) -- (I);}
```

Using Variables

```
% [6] description of lengths; p, i, f %%
\ifthenelse{\lengthtest{#2 cm < #1 cm}}
{\draw [|->|] (0,-#3) -- ++(-#2,0)
 node[pos=0.5,fill=white]{$p$};
\draw [|->|] (0,{-#3 - 0.3}) -- ++(\i,0)
 node[pos=0.5,fill=white]{$i$};
\draw [|->|] (0,{-#3 - 0.15}) -- ++(#1,0)
 node[pos=0.5,fill=white]{$f$};
\draw [|->|] (0,{\h - 0.55}) -- ++(-#2,0)
 node[pos=0.5,fill=white]{$p$};
\draw [|->|] (0,{\h - 0.7}) -- ++(\i,0)
 node[pos=0.5,fill=white]{$i$};
\draw [|->|] (0,{\h - 0.4}) -- ++(#1,0)
 node[pos=0.5,fill=white]{$f$};}
```

3D image
onto 2D space

Coordinates' rotation will be performed twice. At first, rotation $-\alpha$ about z -axis. ($\alpha \sim 120^\circ$ is recommended.)

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} \cos \alpha & \sin \alpha & 0 \\ -\sin \alpha & \cos \alpha & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x' \\ y' \\ z' \end{pmatrix}$$

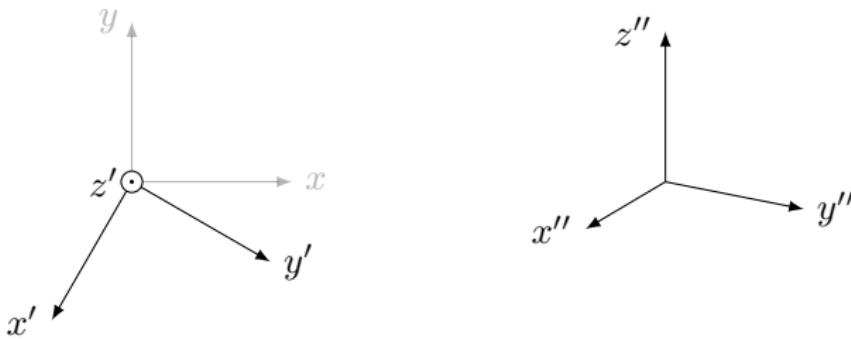

3D image onto 2D space

Next, rotation $-\beta$ about x -axis. ($\beta \sim 70^\circ$ is recommended.)

$$\begin{pmatrix} x' \\ y' \\ z' \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos \beta & \sin \beta \\ 0 & -\sin \beta & \cos \beta \end{pmatrix} \begin{pmatrix} x'' \\ y'' \\ z'' \end{pmatrix}$$

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} x'' \cos \alpha + y'' \sin \alpha \\ -x'' \sin \alpha \cos \beta + y'' \cos \alpha \cos \beta + z'' \sin \beta \\ x'' \sin \alpha \sin \beta - y'' \cos \alpha \sin \beta + z'' \cos \beta \end{pmatrix}$$

3-dim. coords.

$$(L, \textcolor{red}{L}, \textcolor{blue}{L})$$

2-dim. coords.

$$\begin{aligned} & (\{\textcolor{red}{L} \cos \alpha + \textcolor{green}{L} \sin \alpha\}, \\ & \{-\textcolor{red}{L} \sin \alpha \cos \beta + \textcolor{green}{L} \cos \alpha \cos \beta + \textcolor{blue}{L} \sin \beta\}) \end{aligned}$$

3D image onto 2D space

In preamble,

```
\newcommand{\MyCube}[6]{  
  %{<edge length>}%{<rot-alpha>}%{<rot-beta>}  
  %{<color-x>}%{<color-y>}%{<color-z>}  
  \begin{tikzpicture}  
    \draw[fill=#4] ({0.5*#1*cos(#2)+0.5*#1*sin(#2)}, {-0.5*#1*  
      sin(#2)*cos(#3)+0.5*#1*cos(#2)*cos(#3)+0.5*#1*sin(#3)} ) -- ++({-#1*sin(#2)}, {-#1*cos(#2)*cos(#3)}) --  
    ++(0, {-#1*sin(#3)}) -- ++({#1*sin(#2)}, {#1*cos(#2)*  
      cos(#3)}) -- cycle;  
    \draw[fill=#5] ({0.5*#1*cos(#2)+0.5*#1*sin(#2)}, {-0.5*#1*  
      sin(#2)*cos(#3)+0.5*#1*cos(#2)*cos(#3)+0.5*#1*sin(#3)} ) -- ++({-#1*cos(#2)}, {#1*sin(#2)*cos(#3)}) -- ++(0,  
      {-#1*sin(#3)}) -- ++({#1*cos(#2)}, {-#1*sin(#2)*cos(#  
      3)}) -- cycle;  
    \draw[fill=#6] ({0.5*#1*cos(#2)+0.5*#1*sin(#2)}, {-0.5*#1*  
      sin(#2)*cos(#3)+0.5*#1*cos(#2)*cos(#3)+0.5*#1*sin(#3)} ) -- ++({-#1*cos(#2)}, {#1*sin(#2)*cos(#3)}) -- ++({-  
      #1*sin(#2)}, {-#1*cos(#2)*cos(#3)}) -- ++({#1*cos(#2)},  
      {-#1*sin(#2)*cos(#3)}) -- cycle;  
  \end{tikzpicture}  
}% end of newcommand 'MyCube'

3D image—‘tikz-3dplot’

In the preamble,

```
\usepackage{tikz-3dplot}
```

In the main document,

```
\tdplotsetmaincoords{70}{110}
\begin{tikzpicture}[tdplot_main_coords]
\draw[fill=black!5] (0.5,0.5,0.5) -- ++(0,-1,0) --
++(0,0,-1) -- ++(0,1,0) -- cycle;
\draw[fill=black!30] (0.5,0.5,0.5) -- ++(-1,0,0) --
++(0,0,-1) -- ++(1,0,0) -- cycle;
\draw[fill=black!10] (0.5,0.5,0.5) -- ++(-1,0,0) --
++(0,-1,0) -- ++(1,0,0) -- cycle;
\end{tikzpicture}
```

This is equivalent to ‘\MyCube{1}{110}{70}…’
